## Comparative study of selected personality traits between individual and team game players of district Shopian

**Nasir Ahmad Khan and Dr. Ganesh Khandekar**

### Abstract

The main purpose of the study was to comparison of selected personality traits between individual and team game players of district Shopian. The data obtained from the responses given by individual and team game players on the personality trait scale questionnaire prepared by Rekha Agnihotri (Gupta) contain 60 items, questionnaire was used. The data was collected from 100 male and female subjects such as individual and team game players of district Shopian on the basis of responses given by the subjects on three characteristics like extrovert, introvert and ambivert and after that the collected data was analyzed by comparing the means of individual and team game players and was again statistically analyzed by applying t-test to check the significant difference among selected variables. The subjects for the present undertaken study were selected by a standard sampling technique called as simple random sampling method. On the basis of experience and knowledge of the researcher, it was hypothesized that there would be significant difference of individual and team game players of district Shopian.

**Keywords:** Personality trait, individual game players, team game players

### Introduction

Personality is a set of traits that define the way a person's behavior is perceived. Personality is the particular combination of emotional, attitudinal, and behavioral response patterns of an individual. Different personality theorists present their own definitions of the word based on their theoretical positions. The term personality is derived from the Latin word 'persona' it means or 'mask' which actors used to put on whenever they appeared on the stage in Rome later persona was understood to be specific role on the state of Romans.

Personality is mental organization of a human being at any stage of his development. The human being is a completely integrated functioning unit as a complete whole is separates the physical from the mental or leads to a dualistic interpretation of the facts of human existence cannot be accepted to us.

### Introversion

Introversion is the state of tendency towards being wholly or predominantly concerned with and interested in one, sown mental situations. They often take pleasure in solitary activities such as reading, writing; drawing and using computers. The archetypal artist, writer, sculptor, composer, and inventor are all highly introverted.

### Extraversion

Extraversion is the act, state, or habit of being predominantly concerned with and obtaining gratification from what is outside the self". Extroverts tend to enjoy human interactions and to be enthusiastic, talkative, assertive, and gregarious. They take pleasure in activities that involve large social gathering, such as parties, community activities, public demonstrations, and business or political groups. Politics, teachings, sales, managing, and brokering are fields that favor extraversion. An extraverted person is likely to enjoy time spent with people and find less reward in time spent alone

**Ambiversion**

Ambiversion is a term used to describe people who fall more or less directly in the middle and exhibit tendencies of both groups. An Ambivert is normally comfortable with groups and enjoys social interaction, but also relishes time alone and away from the crowd. Another potential weakness with trait theories is that they lead people to accept oversimplified classification, or worse offer advice, based on a superficial analysis of their personality

**Methodology**

The main purpose of the study was to comparison of selected personality traits between individual and team game players of district Shopian. It was hypothesized that there would be significant difference. personality traits between individual and team game players of district Shopian

**Source of Data**

Individual and team game players of district Shopian acted as sources of data.

**Selection of Subject**

One hundred subjects were selected for the collection of data which include fifty ty as individual and fifty as team game players belongs to district Shopian.

**Sampling Method**

The subjects were selected by simple random sampling method.

**Criterion Measures**

Following are the criterion measures which were responsible

for collection of data, to testing the hypothesis.

**Personality trait**

The data obtained from the responses given by individual and team game players on the personality trait scale questionnaire prepared by Rekha Agnihotri (Gupta) it contains 60 items.

**Statistical Analysis and Interpretation of Data**

The data obtained from the responses given by Individual and team game players on the personality traits questionnaire prepared by by Rekha Agnihotri (Gupta) contain 60 items. questionnaire was used. The data was collected from 100 male and female subjects such as on individual and team game players of district Shopian the basis of responses given by the subjects on three characteristics introvert, extrovert and ambivert and after that the collected data was analyzed by comparing the means of individual and team game players and was again statistically analyzed by applying t-test to check the significant difference among selected variables.

**Findings**

For the present study, the data was collected from individual and team game players of district Shopian. The statistical result of the taken from individual and team game players of district Shopian. The data collected from the subjects has been statistically analyzed and has been shown in separate tables given below.

The analysis and interpretation of data pertaining to the score of personality traits has been presented in this chapter. To find out comparative difference of personality traits and t-test was applied and which is given below.

**Table 1:** Comparison of Personality Traits Individual and Team Game Players of District Shopian

Name of Players	Mean	S.D.	M.D.	D.F	O.T.	T.T
Individual	7.88	7.77	3.02	98	2.12	2.02
Team Game	4.86	6.33				

**Graph 1:** Comparison of Personality Traits Individual and Team Game Players of District Shopian

**Conclusion**

With the limitations of the study and from the statistical analysis of the collected data it is concluded that there was found significant difference in the personality trait between individual and team game players of district Shopian, while applied 't' test.

The researcher initially pre assumed that there will be a significant difference in the personality trait of individual and team game players of district Shopian. After the statistical analysis interpretation of data it was found that there is significant difference because in major cases the mean difference exceeds than critical difference at the level of

significance 0.05.

In this study there is found significant difference, hence the researcher's pre assumed has been accepted.
